AB DERWENT ABSTRACT:
NOVELTY - A compound (I) which inhibits binding of ***tissue*** ***plasminogen*** ***activator*** (tPA) to endothelial cells useful for stimulating proliferation of endothelial cells, is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following: (1) a kringle 2 domain (II) of tPA or its variant for reducing endothelial cell proliferation or inducing cell death; (2) a combination (III) of (I) and a tPA or its fragment comprising the finger domain or its variant for simultaneous or sequential administration for stimulating proliferation of endothelial cells; (3) a combination (IV) of (I) and a compound which inhibits binding of the finger domain of tPA to endothelial cells, for simultaneous or sequential administration for reducing endothelial cell proliferation or inducing cell death; (4) a polynucleotide (V) encoding (II) and comprising a 246 base pair sequence, given in the specification, or its variant for reducing endothelial cell proliferation or inducing cell death; and (5) an expression vector (VI) comprising (V).

WIDER DISCLOSURE - (1) polynucleotide comprising a contiguous sequence of nucleotides that hybridizes to the coding sequence or complement of coding sequence of 527 amino acids defined in the specification, and to (S1); (2) antibodies specific for (II), useful for detecting (II); and (3) ***composition*** for stimulating proliferation of endothelial cells by modulating the effect of (II) on endothelial cells.

BIOTECHNOLOGY - Preferred Compound: (I) comprises an anti-kringle 2 domain antibody.

ACTIVITY - Anti-tumor; Antirheumatic; Antiarthritic; Antidiabetic; Vulnerary; Vasotropic; Cardiant.

MECHANISM OF ACTION - Inhibitor of binding of (II) to endothelial cells; modulator of cell growth; gene therapy. No biological data is given.

USE - (I) is useful for stimulating proliferation of endothelial cells. The method comprises contacting the cells with (I) and further with tPA or its fragment comprising finger domain of tPA or its variant. (I) and (III) are useful in wound healing, coronary artery disease and critical limb ischemia. (II) is useful for identifying a substance which stimulates proliferation of endothelial cells, by incubating (II) with an endothelial cell membrane in the presence of a test substance, monitoring for binding of the kringle 2 domain to the endothelial cell membrane, and determining whether the test substance is useful in stimulating proliferation of endothelial cells, and further formulating the test substance identified as stimulating proliferation of endothelial cells with a carrier. (II) and (IV) are useful for reducing endothelial cell proliferation or inducing cell death. (II), (IV), (V) and (VI) are useful for treating solid tumors, rheumatoid arthritis and diabetic retinopathy. (All claimed). (V) is useful in recombinant protein synthesis and as therapeutic agents used in gene therapy techniques.

ADMINISTRATION - The inhibitor of (II) is administered at a dose of 0.1-50 mg/kg, preferably 5 mg/kg-2 g/kg, and the nucleic acid at a dose of 1 pg-1 mg, preferably 10 micro-g-1 g, by enteral, topical, oral, buccal, anal, pulmonary, intravenous, intraarterial, intramuscular or intraperitoneal route.

EXAMPLE - The effect of anti-kringle 2 antibody on endothelial cell (EC) proliferation was determined. Human umbilical vein endothelial cell (HUVEC) were incubated with a panel of monoclonal antibodies directed against the individual domains of ***tissue*** ***plasminogen*** ***activator*** (tPA) in the presence of 2 % fetal bovine serum (FBS), but no other EC growth factors. An antibody that recognized the kringle 2 (K2) domain of tPA (7VPA) caused a dose dependent increase in EC proliferation which was determined colorimetrically. A 4-fold increase in HUVEC growth was observed at 500 microg/ml, the highest concentration of antibody used which was statistically significant as compared with the lowest concentration of antibody used. Similar results were obtained when cell numbers were counted directly after adding 7VPA to HUVEC. Antibodies directed to the finger/epidermal growth factor (EGF)-like, kringle 1 (K1) or the protease domains of tPA did not have similar effects on HUVEC growth. Anti-K2 induced HUVEC proliferation was specific for EC cultures as no effect of the antibody was observed on human vascular smooth muscle cells (HVSMC) even though these cells also secrete endogenous tPA. HUVEC cultures were stimulated to proliferate with anti-K2 antibody with the simultaneous addition of antibodies directed to finger/EGF-like, kringle 1 or protease domains of tPA. An anti-finger/EGF monoclonal antibody dose-dependently inhibited HUVEC proliferation induced by anti-K2 antibody. Neither an anti-K1 antibody nor an antibody that inhibited the catalytic activity of tPA blocked the increase in cell growth. In addition, the plasmid inhibitor, ***aprotinin*** blocked anti-kringle 2 induced EC proliferation. These data suggested that binding K2, tPA mediated EC growth was not dependent on plasmin generation, but on a region of tPA located within the finger or EGF-like domains.(48 pages)

NOVELTY - Pharmaceutical ***composition*** (A) for treating disorders of blood coagulation comprises:
(i) at least one pro-protein (I) of coagulation; and
(ii) a receptor-binding competitor (II) that does not affect the physiology of coagulation.
DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:
(1) combined preparation (B) of ***aprotinin*** and ***tissue*** ***plasminogen*** ***activator*** (tPA); and
(2) use of an LRP-ligand (III) (LRP = lipoprotein receptor-related protein) for:
(i) treatment of phenotypic coagulation factor deficiency; or
(ii) increasing the biological half-life of a protein.
ACTIVITY - Antihemophilic; procoagulant.
MECHANISM OF ACTION - (II) is an in vivo stabilizer of (I) since it blocks the receptor involved in clearance and internalization of (I).
USE - (A), also compositions containing only an LRP-ligand (LRP = lipoprotein receptor-related protein), are used:
(i) to treat patients with a phenotypic defect of a blood coagulation factor, especially von Willebrand factor (vWF); and
(ii) to extend the biological half-life of a protein in vivo (especially of factor VIII).
ADVANTAGE - In (A), (I) has increased biological half-life, i.e. the content and effect of endogenous or administered proteins are improved.

AB Background: Shear stress-induced platelet aggregation may initiate arterial thrombosis at sites of pathological blood flow. Shear stress-induced platelet aggregation is mediated by von Willebrand factor (vWf) binding to platelet membrane glycoprotein (GP) Ib and GP IIb/IIIa. Tissue- type plasminogen activator (TPA) induces thrombolysis in coronary arteries through the local generation of plasmin. Plasmin also proteolyses GP Ib and plasma vWf. Methods and Results: Because these effects could mitigate shear stress-induced platelet aggregation, we investigated the effect of fibrinolytic agents on platelet aggregation in response to a pathological shear stress of 120 dynes/cm.sup.2 generated by a cone-and-platen rotational viscometer. Plasmin inhibited shear stress-induced aggregation of washed platelets, and this was associated with a decrease in GP Ib. TPA, at concentrations >= 2000 IU/mL, significantly inhibited shear stress-induced platelet aggregation of platelet-rich plasma without a decrease in platelet GP Ib. In plasma-platelet mixing experiments, we determined that the TPA effect was localized to plasma. Purified vWf multimer degradation by TPA (in the presence of exogenous plasminogen) was associated with the loss of the capacity of vWf to support shear stress-induced platelet aggregation. Conclusions: These results demonstrate that TPA inhibits platelet aggregation in response to pathological shear stress by altering the multimeric ***composition*** of vWf. This effect of TPA on shear stress-induced platelet aggregation may contribute, along with fibrinolysis, to the therapeutic effect of TPA in restoring blood flow during acute coronary artery thrombosis.
